

Fit for Flight

Probably the most unusual model glider you will ever build – this workshop provides an investigation into the development of flight through the ages.

Fit for Flight channels children's curiosity when investigating materials and their properties. This exciting new workshop has children learning about the engineering of early flight aircraft, what materials were used compared with today's aircraft and then look at the materials used in our humanly constructed world around us. The children then build and test a flying model and experiment with its flight parameters too!
