

## Adaptation and Camouflage II

*This engaging workshop covers Darwin's discovery of natural selection through hands on investigations specially designed for children to gain a sound understanding of the concept. The workshop brings brilliant interactive learning activities that underpin this curriculum topic.*

In a fun and informative activity, children investigate how predator and prey populations are changing and how different species have adapted to survive in the world around them.

Children will then learn the importance of camouflage as part of animal adaptation for survival and discover the techniques they use in creating their own camouflage – all in a fun activity where they design their camouflage to hide their animals within our custom made habitats!
